To whom it may concern:

REGARDING OXYSURE SYSTEMS

For the past five years I have watched Julian Ross and his team develop the groundbreaking OxySure® Systems Portable Emergency Oxygen System. My interest in OxySure Systems was more than curiosity about a unique and remarkable scientific breakthrough; it was also based upon my experience in Law Enforcement and Homeland Security for the past forty years. This experience allowed me to understand what an important breakthrough this technology represents, and how it complements the work of first responders and emergency service personnel. The ability of a layperson to immediately apply safe pure oxygen in the field, while waiting for first responders will improve and outcome and save lives in situations that otherwise would be fatal.

I have no doubt that OxySure Systems will result in many lives being saved in the healthcare, emergency service, safety, security and law enforcement arenas. The potential of this technology is just now being fully understood and I believe that it can become a world standard in multiple applications including aviation, mining, and off shore drilling.

I am truly impressed with the management team that has been assembled at OxySure Systems and have no doubts that this team will be successful in developing and marketing the full potential of this world class technology.

Sincerely,

**Oliver "Buck" Revell
Associate Deputy Director, FBI (Ret.)
President**
